Abstract

Recognition of pregnancy danger plays an important role in preventing and reducing maternal mortality. Pregnant women can identify the danger signs of pregnancy. Therefore, the danger signs during pregnancy need to be known by pregnant women, especially those that threaten the health of the mother and the fetus who are pregnant. The minimum needs to be known by pregnant women in the community to recognize pregnancy danger signs, namely bleeding out of birth canal, excessive nausea, preeclampsia and eclampsia , premature rupture of membranes, and fetal movements that are not felt. Medan Sunggal Health Center is one of the village areas assisted by the USU Nursing Faculty. Based on the results of previous studies of pregnant women, it was found that there were still many pregnant women who did not know about the signs and dangers during pregnancy. The main cause is the limited knowledge of mothers about the signs and dangers of pregnancy and the mother's skills to overcome the lack of information about the signs and dangers of pregnancy. Posyandu cadres who have played an active role have been felt to be weak in providing education about information on signs and harms of pregnancy. Posyandu cadres have the potential for their role as agents of change. Therefore to overcome the problem of lack of information about the signs and dangers of pregnancy, it is necessary to improve the method of delivering information on signs and dangers of pregnancy, by involving several parties who can later collaborate in dealing with information problems for pregnant women, involving KIA officers from Sunggal Health Center, cadres , and invite pregnant women.

Keywords : *information, pregnancy, danger sign*

INTRODUCTION

The danger signs of pregnancy are signs that indicate a danger that can occur during pregnancy / antenatal period, which if not reported or undetectable can cause death. Recognition of pregnancy danger plays an important role in preventing and reducing maternal mortality. Pregnant women can identify the danger signs of pregnancy through the Maternal and Child Health (KIA) book, which they have had since pregnancy (Pusdiknakes, 2003). Complications of pregnancy, childbirth and childbirth are important health problems, if not addressed it will cause a high maternal mortality rate. The death of a mother in the process of reproduction is a worrying tragedy. The existence of a mother is a milestone for achieving a prosperous family and the death of a mother is a disaster for her family. The social and economic impacts of this event can be very large, both for families, communities and the workforce.

One of the causes of the risk of maternal death and illness is one that is not detected by danger signs during pregnancy due to irregular ANC visits (Komalasari, 2010). Therefore, danger signs during pregnancy need to be known by pregnant women especially those that threaten maternal and fetal health. the amount that is needed by pregnant women in the community to recognize the danger signs of pregnancy, namely bleeding from the birth canal, nausea, excessive vomiting, preeclampsia and eclampsia, premature rupture of the membranes, and undetected fetal movements (Salamah 2006, p.98).

The research conducted by Mahardani at the Sawan I Bali Health Center (2011) showed that 54.2% of pregnant women had insufficient knowledge in early detection of the danger signs of pregnancy. The Lestari (2012) study in Ambarawa said that 61.2% of pregnant women were categorized as lacking in utilizing MCH books to obtain information about the danger signs of pregnancy. The danger signs of pregnancy are signs that indicate a danger that can occur during pregnancy / antenatal period, which if not reported or undetectable can cause death. Recognition of pregnancy danger plays an important role in preventing and reducing maternal mortality.

Pregnant women can identify the danger signs of pregnancy through the Maternal and Child Health (KIA) book, which they have had since pregnancy (Pusdiknakes, 2003). Complications of pregnancy, childbirth and childbirth are important health problems, if not addressed it will cause a high maternal mortality rate. The death of a mother in the process of reproduction is a worrying tragedy. The existence of a mother is a milestone for achieving a prosperous family and the death of a mother is a disaster for her family. The social and economic impacts of this event can be very large, both for families, communities and the workforce.

METHOD OF ACTIVITY

The methods of assistance included lectures, discussions, training, demonstrations, mentoring, and program evaluation. Lectures, discussions, demonstrations and training were conducted to increase the knowledge about product diversification. Further assistance was done for all the discussions that had been given. To measure the success of the program, the team conducted an evaluation from the beginning until the end of the program.

RESULT AND DISCUSION

The number of participants invited to the event was 27 people, consisting of 18 pregnant women, 6 posyandu cadres, and 2 Sunggal Puskesmas officers. The enthusiasm of the participants in the counseling activity on pregnancy signs was extraordinary. Most of the participants who were pregnant women. So this participant is expected to also be able to apply it when at home, and provide knowledge and motivation they get to their pregnant colleagues so that they can undergo a healthy pregnancy.

Table 1
Frequency Distribution of Characteristics of Pregnant Women

N = 18

Characteristic	Frequency	Percentage (%)
Kelompok Trimester		
Trimester I	1	5,5
Trimester II	5	27,8
Trimester III	12	66,7
		100%
Age		
20-30 years old	11	61,1
31-40 years old	6	33,3
> 40 years old	1	5,5

The process carried out by the next team leader is to discuss the right time to make the next visit for the implementation of the activity. Based on proposals from residents and the head of the Posyandu cadre, activities are carried out in the morning with a schedule of activities in the third week of the following month. Activities carried out by the team leader before the implementation of the activity, the team leader prepares tools in the form of leaflets, communication media and documentation tools.

Presenters prepare material and provide counseling to mothers.

Pregnancy awareness counseling activities for pregnant women were carried out on Wednesday, September 19, 2018 at the Medan Sunggal village office at 09.00 WIB. The counseling participants were present before 09.00 WIB. Arriving at the location, we met with the mothers, and a group of posyandu cadres while distributing leaflets to the counseling participants, puskesmas officers and posyandu cadres.

Figure 1. Distribution of Leaflets from Presenters

When the activity will begin, the Presenter first provides direction to pregnant women about the benefits and objectives of counseling about the signs and dangers of pregnancy for pregnant women.

Figure 4. Termination of Extension Activities

Hazard detection and pregnancy complications are one of the efforts made in antenatal care given to pregnant women from conception to the onset of labor. The aim is to monitor the development of pregnancy in improving maternal health and normal fetal development. Screening to predict an illness, therefore we can find out those who will experience danger in their pregnancy. By detecting early illness can be distinguished pregnant women who will experience and who have experienced complications. Antenatal services aim to provide quality antenatal care and early detection of complications as early as possible

CONCLUSION

The group of pregnant women is very enthusiastic to participate in counseling activities and this is a strength map

to empower women empowering in community groups, especially in conducting management to prevent maternal and fetal deaths during pregnancy and to support the welfare of the mother and fetus during pregnancy. Dissemination of health information about signs and dangers during pregnancy is very much needed and is expected to be facilitated by local health workers. Through this activity, it is expected that the success of the welfare of the mother and fetus during pregnancy can be realized, where there is still very little policy support in the empowerment program for pregnant women. This will also help the mother to make decisions for health care during pregnancy and her baby.

Maternal and fetal health services are urgently needed by the community because of inadequate services and facilities, and minimal human resources in the Sunggal neighborhood, so it is strongly recommended that proactive maternal health services and attention from various parties be needed to improve health to reduce maternal mortality and fetus.

ACKNOWLEDGEMENT

We would like to express our gratitude and appreciation to all of the parties involved in this project, especially to the Ministry of Research, Technology and Higher Education that made this project possible. We also would like to express our gratitude to the LPPM of University of Sumatera Utara which has provided guidance and motivation to our team until the very end of this project
